### Search Notes

Dear Examiner Parkin,

Here are the results of your search.

Please feel free to contact me if you have any questions.

Subject:

Sequence Search: U.S. Serial No. 10/001,407

Please search SEQ ID NOS.: 10 and 15 from U.S. Serial No. 10/001,407 (Yang, Y., and T. Burrell) v. all relevant databases, including interference. SEQ ID NO.: 10 corresponds to a region of the HIV-2 genome so it will probably pick up a large number of full-length sequences. Can you limit the search results to pick up ONLY nucleic acid sequences that are =<100 nucleotides in length for both sequences?

Place results on both disk and paper.

Thanks!

JSP REM 3D39 AU 1648 2-0908

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (revised)
(first entry)
```

The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs wit 1st and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA; or providing a hybridisation probe and detectable label, hybridising HIV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C

With

Detecting human immunodeficiency virus-2 nucleic acids in a sample, by amplifying nucleic acids with oligonucleotides and detecting nucleic acid, or hybridizing nucleic acid with a probe and detecting probe:target

duplex.

Claim 10; Page 25; 58pp; English.

WPI; 2002-489953/52.

The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA; or providing a combatter probe and detectable label, hybridising HIV-2 NA with the probe to form probe and detectable label, hybridising HIV-2 NA with the considerable to form probe the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA considerable serum and also as components of multiplex amplification creactions that synthesise amplicons corresponding to polymucleotides of unrelated viruses, e.g. HIV-1, hepatitis B virus (HBN) and hepatitis C virus (HCV). ABK93877-ABK93910 represent HIV-2 detection probes of the vive field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and D of HIV-2. The method is useful for amplifying and detecting the NA in blood serum and also as components of multiplex amplification reactions that synthesise amplicons corresponding to polynuclectides of unrelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C virus (HCV), ABK93877-ABK93910 represent HIV-2 detection probes of the invention.                                                                                                 The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 1st and 2nd amplification oligonuclectides, amplifying HIV-2 nuclectide Sequence, and detecting the amplified NA; or providing a CC probe to form probe and detectable label, hybridising HIV-2 NA with the CC probe to form probe:target duplex, and detecting the duplex. The method CC product such as plasma or serum, and also for detecting subtypes A, B, C CC in blood serum and also acomponents of multiplex amplification CC reactions that synthesise amplicons corresponding to polynuclectides of CC curselated viruses, e.g. HIV-1, hepatitis B virus (HAV) and hepatitis C CC invention.                                                                                                                                                                                                                                                                                                           The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 1st and 2nd amplification oligonuclectides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA; or providing a hybridisation probe and detectable label, hybridising HIV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA in blood serum and also as components of multiplex amplification reactions that synthesise amplicons corresponding to polynucleotides of unrelated viruses, e.g. HIV-1, hepatitis B virus (HEV) and hepatitis C virus (HCV). ABK93877-ABK93910 represent HIV-2 detection probes of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting human immunodeficiency virus-2 nucleic acids in a sample, by amplifying nucleic acids with oligonucleotides and detecting nucleic acid, or hybridizing nucleic acid with a probe and detecting probe:target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 1st and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA; or providing a hybridisation probe and detecting the amplified NA; or providing a hybridisation probe and detectable label, hybridising HIV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA in blood serum and also as components of multiplex amplification reactions that synthesise amplicons corresponding to polynucleotides of unrelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C virus (HCV). ABK93877-ABK33910 represent HIV-2 detection probes of the invention. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with 2 lst and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA, or providing a contacting NAs with the probe to form probe and detectable label, hybridisally HIV-2 NA with the construction of the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA c contact and also as components of multiplex amplification that synthesise amplicons corresponding to polymucleotides of currelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C virus (HCV). ABK93877-ABK93910 represent HIV-2 detection probes of the xxx

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200234951-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human immunodeficiency virus 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human immunodeficiency virus 2; HIV-2; HIV-1; hepatitis B virus; HBV; hepatitis C virus; HCV; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (GENP-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human immunodeficiency virus type 2 detection probe #13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present PCR primer is used to amplify human deficiency type 2 (HIV-2) nucleic acids. The specification also describes primers and probes for HIV-1 and HIV-2. The primers and probes are useful for amplifying and biological samples, and HIV-2 and all their subtype nucleic acids in Acquired Immunodeficiency Syndrome (AIDS). The primers are able to detect all HIV-1 and HIV-2 subtypes without detecting non-related viruses. The primer sets for HIV-1 and HIV-2 are compatible with each other, and can more than one primer set to amplification assay for HIV-1 and HIV-2. Using overlap a common probe region maximises strain sensitivity and robustness overlap a common probe region maximises strain sensitivity and robustness
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABK93889;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hybridisation probe and detectable label, hybridising HIV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the presence of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA in blood serum and also as components of multiplex amplification reactions that synthesise amplicons corresponding to polynucleotides of unrelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C virus (HCV). ABK93877-ABK93910 represent HIV-2 detection probes of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                        The env gene of HIV was subjected to in vitro mutagenesis to remove the sequences encoding the rex protein and the LTR region from the 3' end of the gene and to delete the putative immuno-suppressive (18) region (amino acids 583-599). Mutagenesis was performed using primers LTR2 and MUENSVISR using pIBI25mutenv8 as template. Mutagenised clones were identified by hybridsation and restriction analysis. See also AAQ35328-437.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting human immunodeficiency virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with CC ist and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide base sequence, and detecting the amplified NA; or providing a CC hybridisation probe and detectable label, hybridising HIV-2 NA with the probe to form probe:target duplex, and detecting the duplex. The method is useful for detecting the probe of HIV-2 NAs in a lysate or a blood product such as plasma or serum, and also for detecting subtypes A, B, C and D of HIV-2. The method is useful for amplifying and detecting the NA Ci in blood serum and also as components of multiplex amplification CC reactions that synthesise amplicons corresponding to polynucleotides of currelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C corrus (HCV). ABK93877-ABK93910 represent HIV-2 detection probes of the curve that the control of the curve that synthesise amplication of the currelated viruses.
                                                                                                                                Matches
                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                      The present invention provides a database of human samples obtained from healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the samples by parameters such as age, sex and ethnicity. This is useful in linking markers with diseases, susceptibility to infection and drug responses. The present sequence was used in an assay to demonstrate the uses of the database of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a database of human samples obtained free healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the sample by parameters such as age, sex and ethnicity. This is useful in linkin markers with diseases, susceptibility to infection and drug responses. The present sequence was used in an assay to demonstrate the uses of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 100 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a database for identifying polymorphic genetic markers, comprises obtaining data relating to members of a healthy population and entering the information into a database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Braun

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of human ubiquitin-like protein 14. The sequences can be used in the treatment of cancer, haemopathy and HIV infection. The present sequence is a probe for the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ubiquitin-like protein 14; cancer; haemopathy; HIV infection; gene therapy; probe; ss.

                                                                                                                                                                                                          LexA fusion proteins (see also AAWI7781-84), the Y-Oligomer, is prepd. by annealing labelled oligonuclectide T1 (AAT68634), v2 (AAT68635) and v1/T2 (AAT68636). The reaction is performed with 5 nM of the Y-Oligomer and 250 nM of protein. The 5' end-labelled T1 strand of the Y-Oligomer migrates as a 16-nucleotide on denaturing gel. The disintegration product is a 30-mer. Fusion protein INI-288/LexA (AAWI7782) showed over 150% of the disintegration activity of HIV-1
                                                                                                                                                                                                                                                                                                                                                                 Fusion protein comprising retroviral integrase and DNA binding regions useful for integrating donor DNA into specific sites on target DNA, especially for inactivating oncogene(s) or inserting therapeutic genes.
                                                                                                                                                                     Sequence 33

/note="Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site 2: Ecc RI; lst strand cDNA was prepared from 12 pooled bulk tumor samples and primed with a Not I - oligo (dT) primer. Double-stranded cDNA was ligated to Ecc RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Ecc RI sites of the modified pT7T3 vector. Library went through one round of normalization. "

/note="Cryan: Developing flower buds; Vector: Invitrogen
PCR4 TOPO Vector; This EST was obtained with the CDNA-AFLP
method (Bachem et al.Plant Journal 9:745-753, 1996). Total
RNA was extracted from three female fertile and three
female sterile alfalfa plants from an F1 population
obtained by crossing the plants B17 and P13 (Rosellini et
al. Theoretical and Applied Genetics, 97:1 289-1295,
1998). Equal amounts of RNA from each fertile or sterile
plant were bulked and used for the CDNA-AFLP protocol.
The restriction endonucleases EcoRI and MseI were used.
Bands that were polymorphic between the female sterile and
female fertile bulks were isolated from the polyacrilamide
gel, cloned in a plasmid vector (Invitrogen PCR4 TOPO) and
sequenced using the M13F primer. The published sequence
begins and ends with the EcoRI (GAATTC) and MseI (TTAA)
recognition sequences, respectively. The technical help of
Francesco Panara is gratefully acknowledged."

                                                                       Conservative
                                                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi[4732114]gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /clone_lib="Melton Normalized Human Islet 4 N4-HIS 1"
/note="Organ: Pancreas; Vector: pSPORTL; Site 1: Not 1;
Site 2: Sal 1; Starting library constructed using
SuperScript Plasmid Library kit (Life Technologies). cDNA
made by oligo-dT prining. Size-selected by column
fractionation; average insert size 1.08 kb. Library was
amplified once on solid support and plasmid DNA from
library was prepared. The library DNA was normalized by
method #4 from Bonaldo, Lennon, and Soares 1996 Genome
Research 6:791-806; 0.5 microgram single-stranded library
plasmid DNA was mixed with 5 micrograms PCR product
representing library inserts and hybridized to an Ecot of
20. Single-stranded (unhybridized) plasmids were isolated
by hydroxyapatite chromatography and used to make this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        m, for clone orders contact: info@image.llnl.

RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu,' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score
